                                                                                                                                                                                                                                                        'Complete genome sequence
                                                                                                                               PUNCTION: Gas vesicles are small, hollow, gas filled protein structures that are found in several microbial planktonic microorganisms. They allow the positioning of the organism at the favorable depth for growth. GvpA type proteins form the essential core of the structure.

SUBCELLULAR LOCATION: Gas vesicle membrane.
SIMILARITY: BELONGS TO THE GAS VESICLE PROTEIN TYPE A FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            111 GGGGS 115

DBVELOPMENTAL STAGE: At stage 21, expressed in leg buds in a superficial proximomedial domain, expressed in leg buds to a superficial proximomedial domain, expression is enhanced by stage 23. By stage 25, expression is elaborated to include both leg and wing. By stage 35, expressed in all muscle-to-bone attachment sites. Expressed also in a wing aponeurosis, a tendinous element arranged in flattened bands, and in some of the flattened sheets of connective tissue associated with muscle.

(BY SIMILARITY).

(C) -1- SUBUNIT: EFFICIENT DNA BINDING REQUIRES DIMERIZATION WITH ANOTHER CC BHLH PROTEIN. HOMODIMER (BY SIMILARITY).

(C) -1- SUBCELLULAR LOCATION: Nuclear.

(C) -1- DISSUE SPECIFICITY: SUBSET OF MESODERMAL CELLS.

(C) -1- DISSUE SPECIFICITY: SUBSET OF MESODERMAL CELLS.

(C) -1- DISEASE: Defects in TWIST1 are one of the causes of Saethre-Chotzen syndrome (SCS) [MIM:1010400]; also known as autosomal dominant defect characterized by minor skull and limb anomalies.

(C) -1- DISEASE: Defects in TWIST1 are the cause of Robinow-Sorauf syndrome (RSS) [MIM:180750]; also known as craniosynostosis-bifid by minor skull and limb anomalies which is very similar to Saethre-Chotzen syndrome.

(C) -1- DISEASE: Defects in TWIST1 are a cause of Baller-Gerold syndrome (BSS) [MIM:218600]. BGS is a craniosynostosis with radial defects along with other features, including small, round ears with C along with other features, including small, round ears with SC along with other features, including small, round ears with SC along with other features, including small, round ears with SC along with other features, including small, round ears with SC along with other features, including small, round ears with SC along with other features, including small, round ears with SC along with other features of Saethre-Chotzen syndrome.

(C) -1- SIMILARITY: BELONGS TO THE BASIC HELIX-LOOP-HELIX (BHLH) FAMILY OF TRANSCRUTTOTON EXCROPSED
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      RA Strausberg R.D., Collins F.S., Wagner L., Schammen C.M., Schuler G.D., RA Klausner R.D., Collins F.S., Wagner L., Schammen C.M., Schuler G.D., RA Altschul S.F., Zeeberg B., Buetow K.H., Schaefer C.F., Bhat N.K., RA Altschul S.F., Zeeberg B., Buetow K.H., Schaefer C.F., Bhat N.K., RA Hopkins R.F., Jordan H., Moore T., Max S.I., Wang J., Heich F., RA Stapleton M., Soares M.B., Bonaldo M.F., Casavant T.L., Scheetz T.E., Stapleton M., Soares M.B., Bonaldo M.F., Casavant T.L., Scheetz T.E., RA Brownstein M.J., Usdin T.B., Toshiyuki S., Carninci P., Prange C., RA Raha S.S., Loquellano N.A., Peters G.J., Abramson R.D., Mullahy S.J., RA Bosak S.A., McEwan P.J., McKernan K.J., Malek J.A., Gunaratne P.H., RA Bosak S.A., McEwan P.J., McKernan K.J., Malek J.A., Gunaratne P.H., RA Villalon D.K., Muzny D.M., Sodergren E.J., Lu X., Gibbs R.A., Villalon D.K., Muzny D.M., Sodergren E.J., Lu X., Gibbs R.A., RA Wilting M., Madan A., Young A.C., Shevchenko Y., Bouffard G.G., RA Histon M., Madan A., Wagne A.C., Schein J.E., Jones S.J.M., Mers R.M., Rodriguez A.C., Grimwood J., Schmutz J., Myers R.M., Blakesley R.W., Touchman J.W., Green E.D., Dickson M.C., RA Butterfield Y.S.N., Krzywinski M.I., Skalaka U., Smailus D.E., Wener A., Schein J.E., Jones S.J.M., Marra M.A.; "Generation and initial analysis of more than 15,000 full-length human and mouse cDNA sequences."; Proc. Chem. 271:3925-3929(1996).
FUNCTION: MICROSOMAL SIGNAL PEPTIDASE IS A ME ENDOPROTESINASE THAT REMOVES SIGNAL PEPTIDES F PROTEINS AS THEY ARE TRANSLOCATED INTO THE LUENDOPLASMIC RETICULIM.
SUBUNIT: COMPLEX OF FIVE DIFFERENT PROTEINS: SPC21, SPC18, AND SPC12.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SUBCELLULAR LOCATION: Integral membrane protein (Potential). SIMILARITY: BELONGS TO THE SPC25 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SWISS-PROT entry is copyright. Genome Biol. 3:RESEARCH0080.1-RESEARCH0080.8 (2002).

-!- FUNCTION: INVOLVED IN TRANSPORT FROM THE ER TO THE GOLGI.

AS WELL AS IN INTRA-GOLGI TRANSPORT (BY SIMILARITY).

-!- SUBCELLULAR LOCATION: Type IV membrane protein. Golgi (By Similarity).
                                                                                                                                                                                                                                                                                                                                                                     Science [2]
